gear boxes

power steering pump fuel equipment

XADO is able to produce the same results in virtually any operating gear box, transfer case, or differential.

We recommend that before treatment you consult a certified technician for diagnosis. Often an amateur is unable to distinguish between the sounds in a differential and a half-axle. A trained technician is best able to make this distinction. That is why, in order to avoid mistakes, we recommend that you consult a XADO service station, where specialists have been trained in the application of XADO Revitalizants and can help save your time, money and nerves.

Having your car treated by an authorized technician allows you to receive not only repair and savings, but also our guarantee.

Sometimes a story is so good it just has to be told:

Mr. Slava Semenenko pushed his Dodge hard along the Kharkov-Kiev highway half the night. The 400 mile trip through northern Ukraine must go well for him to be on time for an important business meeting the next morning. Slava arrived on time but not without some concern. A noise had begun to come from his axles. It got worse and worse until he could not hear the stereo. In Kiev, after his meeting, Slava rushed to the service station. The repairmen were astonished: "How could you reach Kiev at all? The axles are dry, without a single drop of oil!" There was nobody to blame but himself. Before the trip, Slava had checked the oil level and forgot to screw the plugs back in! To make matters worse, he had done it with both axles! Of course, within miles of leaving home, there was no oil left at all. As a result, the pinions of the differentials burned out. The metal became blue. Slava was more than a little concerned; two new axles would cost him thousands of dollars.

After having his axles filled with oil, Slava returned home, axles droning.

The crisis was solved by XADO. Three tubes of XADO "Gel Revitalizant for gear boxes, transfer cases and differentials" for each axle and after just 12 miles of driving, the howling sound reduced distinctly and after 120 miles, disappeared completely. Two years have passed since then and the axles are still as good as new. Thanks to XADO, the story came to a happy end.

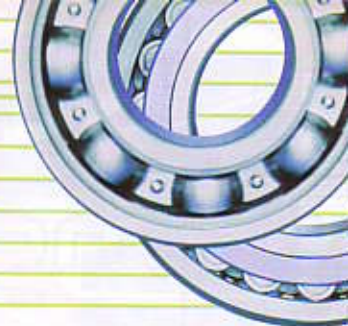

Note! In most cases, a noisy axle is the result of wear. In 99% of these cases, it can be cured by means of revitalization. If the axle is noisy when new, it is most likely a manufacturing defect and the unit will need to be replaced. XADO technology is easy-to-apply. XADO "Gel Revitalizant for gear boxes, transfer cases and differentials" is added into oil mouth. The driver will notice the first result of revitalization in 15 minutes. After 100-200 km of run the howling sound disappears completely.

After treatment, your car is under XADO super protection and XADO will never let you down. It's been proven!

10

10 times stronger than steel!

A fuel pump is a precision mechanism. As it wears, efficiency is lost. Routine wear of plunger parts is aggravated by any contamination of the fuel. Application of **XADO "Gel Revitalizant for High Pressure Fuel Pump"** allows you to restore the pump elements with no down time and no mechanical intrusion. The harder, smoother surface obtained through revitalization prolongs the service life of the pump by several times. The process requires 300 to 400 miles to complete.

If a warmed up diesel engine of your car refuses to start, do not be upset! XADO will help you. Try **XADO "Gel Revitalizant for High Pressure Fuel Pump"** and plunger pair will be restored completely. As always, when you deal with XADO the treatment of the fuel pump will give you no trouble, and you can drive your car in regular mode. You simply squeeze one tube of Revitalizant into fuel tank with a little amount of fuel. Then add 40-60 litres (10-15 gallons) of fuel into the tank and continue your driving.

As the result you obtain reconditioned plunger that will serve you several times longer.

It is quite easy to take your power steering pump for granted. But lose yours and you'll soon remember how much ease and comfort it provides. Your power steering pump also provides safety. It cushions impacts from the road and helps you maintain control in case of a blowout.

XADO "Gel Revitalizant for Power Steering Pumps" is effective in a very short period of time. Revitalization can take as little as 15 minutes. The service life of the reconditioned unit will be almost unlimited. This Revitalizant has been specially formulated to allow for the different standards of hydraulic fluids. It is compatible with all types of oil and hydraulic fluids. Due to its special formula, this revitalizant is able to offer excellent results in the absence of the high loads and high temperatures required by other XADO Revitalizants.
